

ABSTRACT

A device and method for translating language is disclosed. In one
5 embodiment, for example, a method for providing a translated output signal
derived from a speech input signal comprises receiving a speech input signal
in a first language, converting the speech input signal into a digital format
comprising a voice model component representing a speech pattern of the
speech input signal and a content component representing a content of the speech
10 input signal, translating the content component from the first language into a
second language to provide a translated content component; and generating an
audible output signal comprising the translated content in an approximation of
the speech pattern of the speech input signal.
